## Introduction

### Oscillator networks

... are relevant for many fields like

- Neural networks
- Power systems
- Neuromorphic computing

### Understanding

... synchronization is a key part of designing novel computing hardware

### Promising

... architectures can compute e.g. the traveling salesman problem more efficiently than today's computers

## Argument

## Synchronization

Oscillators are synchronized if the states are identical:

- $\mathbf{u} = \hat{u}\mathbf{1}$
- $\mathbf{i}_L = \hat{i}_L\mathbf{1}$

Projection matrix  $\mathbf{P}$  extracts unsynchronized parts:

- $\mathbf{P}\mathbf{1} = 0$
- $\mathbf{P}\mathbf{v} = \mathbf{v}$  if  $\mathbf{1}^T\mathbf{v} = 0$

## Derivation

$$\dot{V} = -\mathbf{i}_L^T \mathbf{P} \mathbf{R} \mathbf{i}_L \underbrace{-\mathbf{u}^T \mathbf{P} \mathbf{W}(\mathbf{z}) \mathbf{u}}_{P_{\text{coupling}}} \underbrace{-\mathbf{u}^T \mathbf{P} \mathbf{i}_{\text{NL}}(\mathbf{u})}_{P_{\text{NL}} \leq \mathbf{u}^T \mathbf{P} \Delta G_{\text{NL}} \mathbf{u}} \leq -\mathbf{i}_L^T \mathbf{P} \mathbf{R} \mathbf{i}_L - \mathbf{u}^T \mathbf{P} [\mathbf{W}(\mathbf{z}) - \Delta G_{\text{NL}} \mathbf{1}] \mathbf{u} \stackrel{!}{\leq} 0$$

A sufficient synchronization criterion is  $\lambda_2 \{ \mathbf{W}(\mathbf{z}) \} > \max \{ 0, \Delta G_{\text{NL}} \}$ .

## Lyapunov Candidate

$$V = \frac{1}{2} \begin{bmatrix} \mathbf{u} \\ \mathbf{i}_L \end{bmatrix}^T \begin{bmatrix} \mathbf{C}\mathbf{P} & 0 \\ 0 & \mathbf{L}\mathbf{P} \end{bmatrix} \begin{bmatrix} \mathbf{u} \\ \mathbf{i}_L \end{bmatrix}$$

$V$  should be

- zero when the oscillators are synchronized
- decreasing when they are not

# Algebraic connectivity of Random Graphs

## Cutting Edges

Connectivity drops linearly with memristors switching to high resistive state.

## Varying Node Numbers

Changing the number of oscillators has limited effect on synchronization.

- 3 Outline of Argument
- 4 Emulations
- 5 Small World Graphs
- 6 Conclusion**

## Conclusion

Key factors for the synchronization criterion are

- Algebraic connectivity of the coupling graph
- Maximal magnitude of negative nonlinearity slope

For Small-World Graphs

- Memristors switching to high resistive state have linear impact on connectivity
- Synchronization behavior will likely change slowly when disconnecting oscillators

For more detail see [1].
